Hradená liečba kompenzovanej a dekompenzovanej chronickej vírusovej hepatitídy typu B sa môže indikovať len u dospelých pacientov pri chronickej vírusovej hepatitíde typu B, ak je

- trvale alebo intermitentne zvýšená aktivita ALT trvajúca najmenej šesť mesiacov pred začatím liečby (dĺžka trvania nie je rozhodujúca v prípadoch histologicky dokázanej chronickej hepatitídy B),
- pozitivita HBsAg v sére trvajúcej minimálne šesť mesiacov pred začatím liečby,
- pozitivita HBsAg a HBeAg v sére v čase indikovania liečby, výsledok nie starší ako jeden mesiac (HBeAg môže byť negatívny pri infekcii HBeAg negatívnou mutantou),
- overená replikácia vírusu vyšetrením HBV-DNA v sére PCR metódou,
- nález chronickej hepatitídy pri histologickom vyšetrení pečenej biopsie (nie starší ako jeden rok), ak nie je takéto vyšetrenie kontraindikované.

Liečba lamivudínom sa môže indikovať pred začatím liečby interferónom. Hradená liečba podlieha vyhodnocovaniu efektivity v pravidelných trojmesačných intervaloch počas liečby a šesť mesiacov po ukončení liečby a výsledok sa zaznamenáva do zdravotnej dokumentácie pacienta.

Podmienkou hradenej liečby u drogovzo závislých osôb je preukázanie aspoň šesť mesiacov trvajúcej abstinencie pred jej začatím.

Podmienkou pokračovania hradenej liečby u drogovzo závislých osôb je preukázanie abstinencie v trojmesačných intervaloch.

**L01XE01 Imatinib p.o.**

Hradená liečba sa môže indikovať

- a) v chronickej fáze Ph pozitívnej alebo bcr/abl pozitívnej chronickej myelocytovej leukémie,
- b) v akcelerovanej fáze chronickej myelocytovej leukémie bez prídavných cytogenetických zmien,
- c) v blastickej fáze chronickej myelocytovej leukémie, ktorá nevznikla počas liečby imatinibom, bez prídavných cytogenetických zmien s výstupom do štandardnej alogénnej transplantácie krvotvorných buniek,
- d) pri akútnej lymfoblastovej leukémii Ph pozitívnej bez prídavných cytogenetických zmien s výstupom do štandardnej alogénnej transplantácie krvotvorných buniek,
- e) pri neresekovateľnom alebo metastazujúcom malígnom gastrointestinálnom stromálnom nádore (GIST) s pozitivitou KIT (CD 117),
- f) u dospelých pacientov s myelodysplastickými/myeloproliferatívnymi ochoreniami (MDS/MPD) spojenými s preskupeniami génu receptora rastového faktora odvodeného od trombocytov (PDGFR),
- g) u dospelých pacientov s pokročilým hypereozinofilným syndrómom (HES) alebo chronickou eozinofilovou leukémiou (CEL) s preskupením FIP1L1-PDGFR $\alpha$ ,
- h) ako adjuvančná liečba dospelých pacientov, u ktorých je významné riziko relapsu po

resekcii GIST s pozitivitou KIT (CD 117). Pacienti, u ktorých je nízke alebo veľmi nízke riziko recidívy, nemajú dostávať adjuvantnú liečbu.

Za odpoveď na liečbu pri chronickej myelocytovej leukémii sa považuje dosiahnutie hematologickej odpovede do troch mesiacov liečby a dosiahnutie cytogenetickej odpovede po šiestich mesiacoch od začiatku liečby.

Ak u pacienta vymizli nezrelé formy granulopoézy z periférnej krvi a dosiahol cytogenetickú odpoveď (znížením percentuálneho zastúpenia Ph+ buniek v kostnej dreni), je nutné v liečbe pokračovať. Po dosiahnutí kompletnej hematologickej a veľkej cytogenetickej odpovede nasleduje udržovacia liečba.

Ak dôjde u pacienta k progresii ochorenia alebo sa nedosiahne vyššie uvedená liečebná odpoveď, ďalšia liečba nie je hradenou liečbou.

U pacientov s Ph+ alebo bcr/abl pri pozitívnej blastickej kríze je nutné posúdiť cytogenetickú odpoveď liečby po šiestich mesiacoch a zvážiť prípadné ďalšie pokračovanie v liečbe. Pri GIST s pozitivitou KIT (CD117) sa účinnosť zakladá na stupni objektívnej odpovede.
